BSCOOK SECURITY LABS OFFICIAL PROTOCOL AUDIT

Report ID: BSC-SEC-2026-V3
Date: October 2026
Classification: Public Release

Smart Contract Security Assessment & Verification Report

In-Depth Static Analysis, Formal Verification & Architectural Review for the **BSCook Protocol** Single-Sided Uniswap V4 Liquidity Engine deployed on BNB Smart Chain (BSC).

98 / 100	0	0	PASSED
SECURITY SCORE	CRITICAL VULNERABILITIES	HIGH SEVERITY FINDINGS	AVENGERDAO STANDARD

1. Executive Summary

The **BSCook Protocol Security & Engineering Review** evaluated the production smart contracts deployed on BNB Smart Chain. The protocol implements a modern **Single-Sided Uniswap V4 Liquidity Architecture** with native permanent liquidity locking. The analysis confirmed zero honeypot vectors, zero arbitrary token minting capabilities, verified mathematical soundness of single-sided tick boundaries, and confirmed that locked LP positions cannot be withdrawn by any party.

Final Security Status: APPROVED / LOW RISK (Score: 98/100). No backdoors, fund-draining mechanisms, or honeypot logic exist. Deployed tokens are immutable OpenZeppelin ERC20 proxies. Liquidity is permanently locked at block 1 in `BSCookLocker` with zero withdrawal capabilities.

2. Protocol & Architecture Specification

Protocol Name	BSCook Protocol	**Deployment Network**	BNB Smart Chain (BSC Mainnet - Chain ID: 56)
Official Domain	https://bscook.fun	**DEX Integration**	Native Uniswap V4 Single-Sided Pool Engine
Token Supply Model	1,000,000,000 Fixed Supply (18 Decimals)	**Liquidity Vault**	BSCookLocker (Non-Custodial, Permanent LP Lock)
Solidity Compiler	v0.8.20 (viaIR: true, runs: 800)	**Dev-Buy Cap**	0.32 BNB hard cap per launch transaction

3. Scope of Assessed Contracts

Contract Name	Mainnet Contract Address	Audit Classification
BSCookFactory	`0xe8a0beEEdd39af3a87De11d6b120D0fFa874867D`	**Verified Exact Match**
BSCookToken (Impl)	`0x66aEfEE3B1f3163f036Aeee733035df09F49Fc02`	**Verified Exact Match**
BSCookLocker	`0x3a8587057f85eb318F52c2C9ae148940741CFCfD`	**Verified Exact Match**
BSCookTimelock	`0x4cec2C1DA4D2f460402aC38aF04Ed29D0C922c83`	**Verified Exact Match**
BSCookMultiSig	`0xAa2699E1737052869c97a681d3d6d1C9b969120e`	**Verified Exact Match**
ContractValidation	Internal Shared Safety Library	**Verified Exact Match**

4. Core Security Invariants & Code Review

Security Invariant	Code Verification & Invariant Proof	Result
Rug-Pull Immunity	`BSCookLocker` possesses NO functions to withdraw, burn, or reduce locked LP positions. `rescueERC721` contains explicit checks strictly forbidding interactions with locked position IDs.	SECURE / PASSED
Honeypot & Blacklist Immunity	`BSCookToken` is a standard OpenZeppelin ERC20 implementation without transfer fees, blacklists, pause hooks, or post-initialization owner privileges. Sell restrictions are impossible.	SECURE / PASSED
Admin Asset Protection	In `BSCookFactory`, `rescueERC20` explicitly protects users by forbidding the extraction of launched tokens and WBNB. Admin cannot drain active platform pool tokens.	SECURE / PASSED
Single-Sided Math Soundness	Single-sided tick initialization up to `MAX_USABLE_TICK = 887200` with initial price derived from `INITIAL_WBNB_QUOTE = 6 ether` verified for boundary correctness and precision-loss avoidance.	SECURE / PASSED
Anti-Sniper Dev-Buy Cap	Creator initial purchase is hard-capped on-chain at `0.32 BNB` (approximately 5% supply at launch price), preventing single-wallet initial supply monopolization.	SECURE / PASSED
Reentrancy Protection	All external state-mutating functions protected by OpenZeppelin `ReentrancyGuard`. CEI pattern verified across all Uniswap V4 interactions.	SECURE / PASSED

5. Governance & Centralization Transparency

Design Invariant	Specification	Risk Mitigation
Future Locker Migration	`queueLockerChange` allows owner to propose a new locker address with a mandatory **2-day queue delay**.	AFFECTS FUTURE LAUNCHES ONLY Existing launched positions remain permanently locked in the original locker.
Fee Dispute Freezing	`BSCookMultiSig` (2-of-3 threshold) can freeze creator fee claims for a maximum duration of 7 days during disputes.	TEMPORARY TIME LIMIT Fee freeze auto-expires after 7 days; underlying LP principal cannot be modified.

Design Invariant	Specification	Risk Mitigation
Administrative Timelock	Critical operations execute through `BSCookTimelock` with delays enforced between 12 and 48 hours.	**PREVENTS FLASH ADMIN ACTIONS** Community has 12–48 hours advance warning of queued proposals.

6. Static Analysis Verification

Static analysis was executed across the codebase using **Slither 0.10.x** and manual invariant verification. Analysis of reported alerts confirmed that findings related to weak-prng and reentrancy-balance are false-positive artifacts caused by tick modulo operations and guarded nonReentrant Uniswap calls. Zero genuine high-severity issues were confirmed.

7. Protocol Verification Commitment

The BSCook Core Engineering Team affirms that contract bytecode deployed on BNB Smart Chain Mainnet matches the open repository. All positions locked at launch remain non-custodial and permanent.
